## lighting infrastructure context

- approx. **1.6 billion people** do not have access to electricity (IEA 2002), 1/3 of this population lives in India
- International Energy Agency predicts a **less than 1% annual decline** in this number by 2030
- 1 in 4 people exclusively rely on **other fuels**  
kerosene, dung, wood, diesel,  
candles, battery-powered flashlights

the poor pay est. **\$38 billion per year** for fuel-based lighting

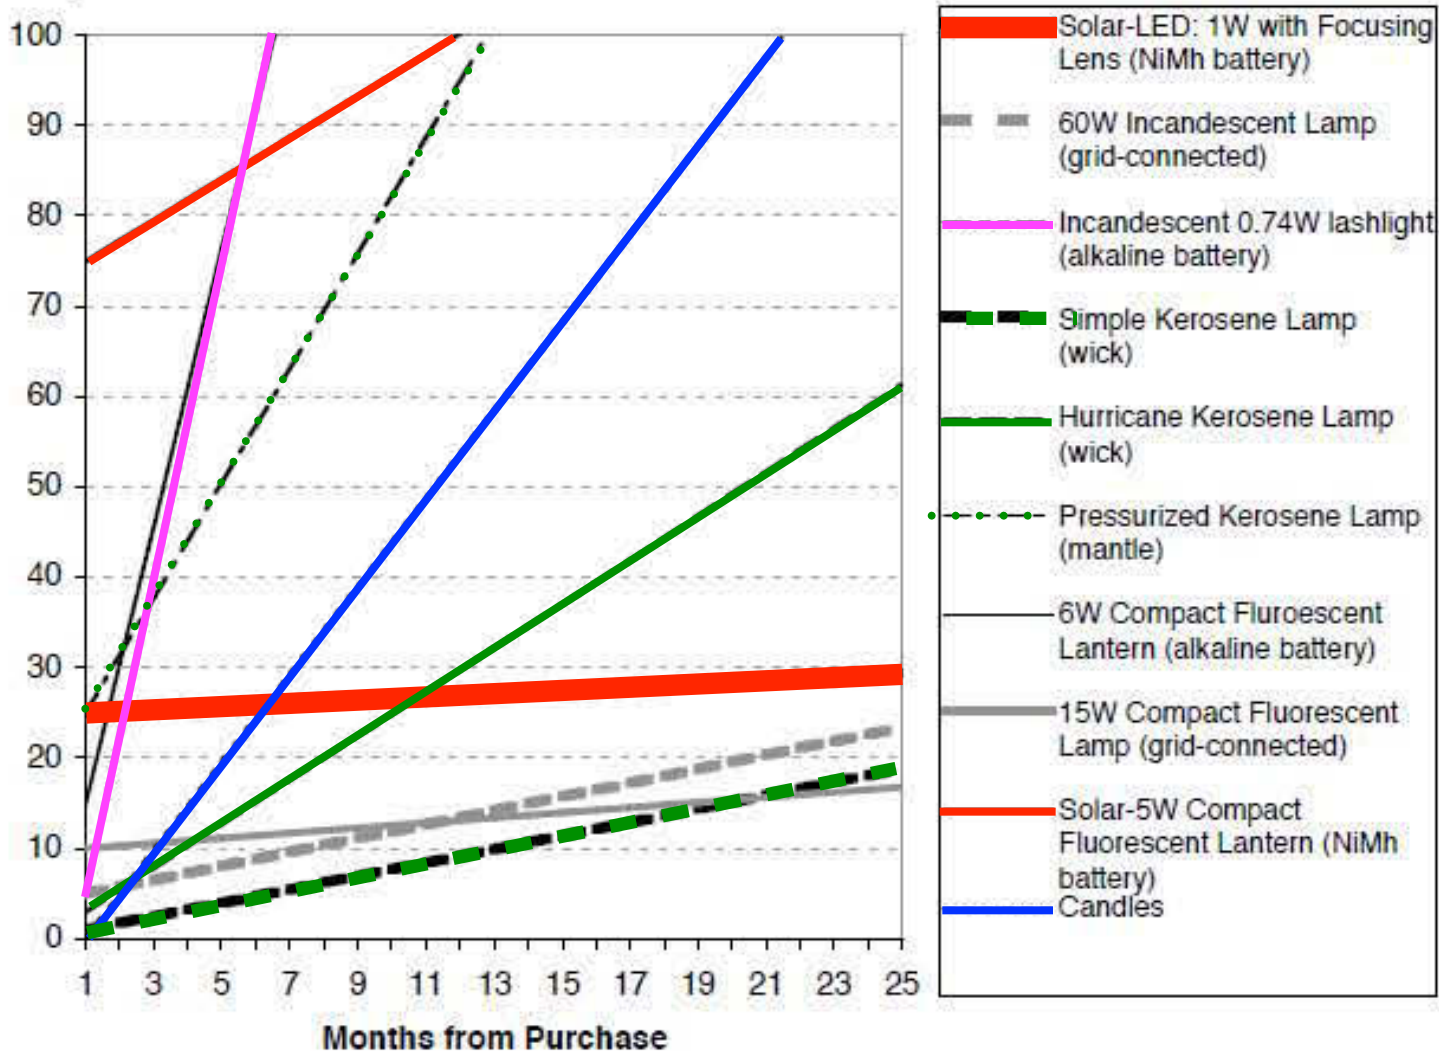

Mills, E. (2005). "The Specter of Fuel-based Lighting" *Science*. Vol. 308. pp.1263-1264.

[http://light.lbl.gov/pubs/mills\\_science\\_fbl\\_full.pdf](http://light.lbl.gov/pubs/mills_science_fbl_full.pdf)

© AAAS. All rights reserved. This content is excluded from our Creative Commons license. For more information, see <http://ocw.mit.edu/fairuse>.

**Cumulative Cost of Ownership (US\$)**

Source: Supplement to Mills, E. "The Specter of Fuel-based Lighting." Science 308 (2005): 1263-4.  
 © AAAS. All rights reserved. This content is excluded from our Creative Commons license. For more information, see <http://ocw.mit.edu/fairuse>.

**Figure S6. First costs (y-intercept) and cumulative operating costs (slope).** Economic payback time (months) for WLED system (heavy black curve) occurs when heavy black curve crosses that of competing technology. Slope is proportional to operating cost (replacement batteries, lamps, candles, wicks, etc.) Curves for grid-connected sources shaded grey.

**Assumptions for Table S3:**

Lamp usage	4 hours/day
Household electricity price (from grid; rural)	0.10 \$/kWh (World Bank 1996) can vary widely depending on local conditions).
D-cell Alkaline price	0.50 \$ per battery (non-rechargeable)
D-cell capacity	3.00 wh
AA-cell NiMh battery cost	1.00 \$ per battery (rechargeable)
AA NiMh battery life	500 cycles
Large NiMh solar lantern battery Life	500 cycles
CFL solar lantern NiMh replacement battery price	35 \$ per battery
60W incandescent lamp price	0.30 \$ per lamp
Simple kerosene wick price	0.22 \$/length
Hurricane lamp wick price	1.00 \$/length
Kerosene tie-on mantle price	1.50 \$/mantle
Flashlight lamp ("bulb") wattage	0.74 2 D ind. cell flashlight; PR6; Philips
Flashlight lamp ("bulb") price	0.30 \$ per lamp
Fixture price for grid-connected CFL or incandescent	5.00 (\$) simplest hard-wired connection or plug-in lamp
Compact fluorescent lamp price (grid-based)	4.00 \$ per lamp
Replacement CFL price for solar lantern	4.00 \$ per lamp
Fuel Price	0.5 \$/liter
Lighting fuel (kerosene)	36.5 MJ/liter (45 MJ/kg; 0.81 kg/l)
Diesel w/v	0.87 kg/liter
Kerosene emissions factor	2.63 kg CO2/MJ
Electricity emissions factor	1100 grams CO2/kWh(e)

**Notes & Sources:**

- Most assumptions for electric light sources reflect high-quality western manufacturing (e.g. lamp life, efficacy); performance of some products can be much lower than assumed.
- LED efficacies projected for end of 2005
- Lumen output values for standard electric sources are average mid-life values (including depreciation "maintenance factors" where applicable, based on IESNA Handbook Maintenance factor from fig. 6-40 IESNA handbook). Values for kerosene lamps are averages of tested levels.
- Derivation of lux values: for general electric sources, assumes even radiation in all directions from source 0.3 m high and 0.5 m from task (lux = 12% lumens). Room contributes another 2% from inter-reflections (3x3x2.5 m room with 50% surfaces). LED values are LBNL measurements, with varying degrees of optical control, 1 m from task. Kerosene measurements by LBNL goniophotometer at reading plane.
- Cost values shown are estimated final retail prices.

## **financial costs**

up to 30% of household income spent on light

*compared to 3% in the USA*

(2009, Buildings Energy Data Book & US Government Bureau of Labor Statistics Consumer Expenditure Survey)

## environmental costs

- 200 Mt of CO<sub>2</sub> emissions for fuel-based lighting in off the grid situations (all lighting – 1889 MtCO<sub>2</sub>)
- improper disposal of batteries
- deforestation where wood replaces other fuels
- light pollution through too much light (poor luminaires, poor lanterns)

## **social costs**

- home-based work and chores becomes difficult at night
- certain crops or types of agricultural work (fishing, salt farming) can have peak-periods that require work around the clock
- lack of time for community activities
- disruption of education, children cannot complete school work
- disruption of health care services (dental care, surgery, emergency relief efforts)
- security

## health costs

- breathing kerosene fumes
- smoke in tight indoor spaces
- particulate emissions from burning fuels
- maternal mortality rates
- danger of fires started by kerosene lanterns or candles
- eye-strain

describing the quality of the visual environment

describing, measuring and designing lighting is always a highly  
**contingent, dynamic process**, dependent on

- task performance requirements (mostly visual)
- mood and atmosphere
- appearance, aesthetic judgments (subjective)
- visual comfort
- health, safety and well-being
- social communication
- point of view
- cost
- environmental concerns

Handbook. 2000. Chapter 10: Quality of the  
Visual Environment.

## brightness

- intensity and amount of light together
- people perceive brightness in relation to the surroundings

- top: naturally bright light, captured in the size of the halation through the photo lens
- bottom: glowing, spiritual feeling

## glare

one area of the scene is much brighter than the rest of the area.

Philips. (2004) *Talk Atmosphere*. p.10-11.

## contrast

“...difference in appearance of two or more parts of a field seen simultaneously or successively.”

(Inst. of Lighting Engineers (2005). Chapter 1. The Outdoor Lighting Guide.)

Without contrast you can't see anything!

- top: positive contrast: object is brighter than the background
- bottom: negative contrast: objects is darker than the background, silhouette

# color temperatures

Courtesy of Lowel Light Inc. Used with permission.

<http://www.lowel.com/edu/images/colortemp/colortemp.jpg>

## some terms

- **flux  $F$  (lumen)**: total quantity of light emitted
- **luminous intensity  $I$  (candela cd, lumens per steradian)**: lumens per unit solid angle ( $\omega$ )  
distribution of light, because light is dependent on the radiance pattern of a light source
- **illuminance  $E$  (lux (lumens per square meter) or footcandles (lumens per square foot))**: magnitude of light on a surface, used to specify lighting levels b/c it's not dependent on the position of the observer
- **luminance  $L$  (candela/m<sup>2</sup>)**: luminous intensity that reaches the eye
- **brightness**: subjective measure based on what people perceive

Inst. of Lighting Engineers (2005). Chapter 1. In *The Outdoor Lighting Guide*, p. 3.

## SI photometry units

Quantity	Symbol	SI unit	Abbr.	Notes
Luminous energy	$Q_v$	lumen second	lm·s	units are sometimes called <i>talbots</i>
Luminous flux	$F$	lumen (= cd·sr)	lm	also called <i>luminous power</i>
Luminous intensity	$I_v$	<b>candela</b> (= lm/sr)	cd	an <i>SI base unit</i>
Luminance	$L_v$	candela per square metre	cd/m <sup>2</sup>	units are sometimes called "nits"
Illuminance	$E_v$	lux (= lm/m <sup>2</sup> )	lx	Used for light <i>incident</i> on a surface
Luminous emittance	$M_v$	lux (= lm/m <sup>2</sup> )	lx	Used for light emitted from a surface
Luminous efficacy		lumen per watt	lm/W	ratio of luminous flux to <i>radiant flux</i>
SI • Photometry

## how to use a basic light meter?

measuring illuminance  $E$  (lux (lumens per square meter) or footcandles (lumens per square foot)):

- compare vertical surfaces with horizontal surfaces
- where is the light source (best guess)
- stray light sources
- measure at eye-level versus higher or lower, measure at the task surface (horizontally)

Illuminance	Example
$10^{-5}$ lux	Light from <a href="#">Sirius</a> , the brightest star in the night sky
$10^{-4}$ lux	Total <a href="#">starlight</a> , overcast sky
0.002 lux	Moonless clear night sky with <a href="#">airglow</a> <sup>[2]</sup>
0.01 lux	Quarter moon
0.27 lux	Full moon on a clear night
1 lux	Full moon overhead at tropical <a href="#">latitudes</a> <sup>[4]</sup>
3.4 lux	Dark limit of civil <a href="#">twilight</a> under a clear sky
50 lux	Family living room
80 lux	Hallway/toilet
100 lux	Very dark overcast day
320–500 lux	Office lighting
400 lux	<a href="#">Sunrise</a> or <a href="#">sunset</a> on a clear day.
1,000 lux	Overcast day ; typical <a href="#">TV studio</a> lighting
10,000–25,000 lux	Full <a href="#">daylight</a> (not direct sun)
32,000–130,000 lux	Direct <a href="#">sunlight</a>

© Wikipedia. License CC BY-SA. This content is excluded from our Creative Commons license. For more information, see <http://ocw.mit.edu/fairuse>.

IESNA recommended lighting levels for tasks (2000)	avg. horizontal illuminance (lux)	avg. vertical illuminance (lux)
general lighting	50	---
circulation	30	30
dining	50	---
kitchen counter	300-500	50-100
reading	300-500	50-100
desk work	300-500	30-100

Data from *The IESNA lighting Handbook: Reference & Applications*. Mark S. Rea, Editor in Chief. Illuminating Engineering Society of North America, 2000.

IESNA recommended lighting levels for outdoor spaces (2000)	avg. horizontal illuminance (lux)	avg. vertical illuminance (lux)
bikeways (in commercial areas, by roadways)	10	20
bikeways (distant from roadways)	5	5
active-inactive building entrances	50-30	30
floodlit buildings, monuments in dark surroundings	n/a	30
floodlit buildings, monuments in bright surroundings (light to dark surfaces)	n/a	30-100
garden general lighting	5	2
garden pathways	10	3

## lighting examples

# D.Light Design Kiran Solar Lantern

**Who:**  
D.Light Design

**Where:**  
Worldwide, produced in China, focused on India

**What:**  
Kiran Solar Lantern

**Impact:**  
bringing down the cost (only \$10)  
4x brighter than a kerosene lamp  
two settings, high and low (4 or 8 hours)

<http://www.greenlaunches.com/alternative-energy/kiran-is-the-most-affordable-solar-lamp.php>

[http://www.dlightdesign.com/home\\_global.php](http://www.dlightdesign.com/home_global.php)

# Grameen Shakti Solar Home Systems (SHSs)

**Who:**  
Grameen Shakti, NGO

**Where:**  
Bangladesh

**What:**  
more than 100,000 solar home systems, 4000 per month on average

**Impact:**  
focusing on the combined goals of poverty and climate change

key innovation is the financial package offered to users who paid in installments

## Solar PV Program

Rural electrification through solar photovoltaic (PV) technology

Rural electrification through solar PV technology is becoming more popular, day by day in Bangladesh. Solar Home Systems (SHSs) are highly decentralized and particularly suitable for remote, inaccessible areas. GS's solar program mainly targets those areas, which have no access to conventional electricity and little chance of getting connected to the grid within 5 to 10 years. It is one of its most successful programs. Currently, GS is one of the largest and fastest growing rural based renewable energy companies in the world. GS is also promoting Small Solar Home System to reach

## Building systems

SHSs can be used to light up homes, shops, fishing boats etc. It can also be used to charge cellular phones, run televisions, radios and cassette players. SHSs have become increasingly popular among users because they present an attractive alternative to conventional electricity such as no monthly bills, no fuel cost, very little repair, maintenance costs, easy to install any where etc.

GS installed SHSs have made a positive impact on the rural people. GS has introduced micro-utility model in order to reach the poorer people who cannot afford a SHS individually. Another successful GS venture is Polli Phone which allows people in off grid areas the facilities of telecommunication through SHS powered mobile phones.

GS has developed an effective strategy for reaching people in remote and rural areas with solar PV technology. It involves:

- Soft credit through installments which makes SHSs affordable
- Advocacy and Promotion
- Community involvement and social acceptance
- Effective after sales service
- Blending Technology with Market Forces

## Task Lights

### SELCO India, Silk farmers

**Who:**

Silk farmers

**Why:**

Dependent on kerosene lamps to feed silkworms

**What:**

**Finance:** Unable to pay the upfront cost of the system, SELCO along with its partner S3IDF worked with a local cooperative bank to provide collateral security for the farmer to avail loan.

**Technical:** Providing a single home light system with two light points to enable portability of light for the farmer in different rooms.

**Impact:**

Saving on purchase of kerosene  
Lower mortality rate of silk worms

# Task Lights

## SELCO India, Solar Powered Headlamps

### Who:

Midwives, flower pluckers, construction workers, rubber tappers

### Why:

Require hands free light for their occupation. Current use is either kerosene lamps or battery operated lights.

### What:

1 W LED, 2.4V headlamp

### Impact:

- Savings from purchase of kerosene
- Enhancing productivity
- Improving safety
- Improving brightness and visibility

# Community Partner Introduction

Public domain image (source: U.S. CIA).

# AsoFenix <http://asofenix.org/>

**Description:** Small Nicaraguan-based NGO focused on rural sustainable development.

**Where:** El Roblar in the department of Boaco, 45 min. hike into this community, located in the mountains. Pit latrines, bucket showers (maybe), hammocks.

## **Projects:**

- feed chopper electrification using micro-hydro turbines
- ?- biodigesters, review designs, possibly designing an internal mixer
- ?- continuation of OJ bag sealer project
- ?- ¿más?

**Description:** Small NGO that researches, develops and applies appropriate, renewable energy technologies in Nicaragua. Focused on supporting community self-determination, local responsibility for the projects, and preserving natural resources. Mujeres Solares de Totagalpa.

**Where:** Totagalpa, just south of Ocotal. Some electrification, comparative wealth, pit latrines, bucket showers.

## **Projects:**

- solar cooker refinement
- ag. charcoal making skill & business plan development
- cell phone chargers
- continuation of stove project

# Other Possibilities

- **Collaboration with D-Lab Health**
- **Charcoal from invasive sea lilies in Jinotega**

# PROJECT TIMELINE

- By this Friday, online survey for project preferences
  - must be completed by Monday, Feb 21
- Project teams formed by Wednesday, Feb 23
- Initial research & sketch model prototypes for March 16

# Muddy Cards!
